

# How to ENABLE ActiveX for your Internet Explorer?

## What is ActiveX?

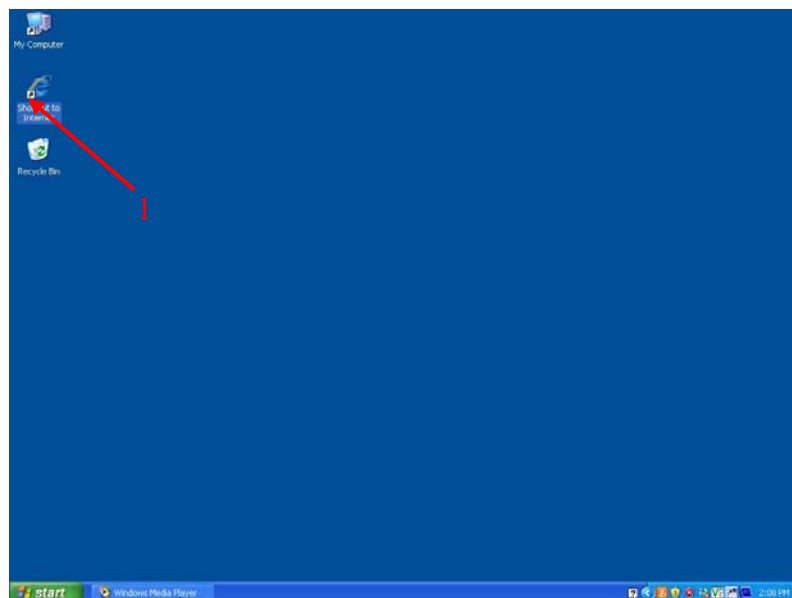

Active X is the name for a selection of object-oriented tools and programming technologies that were developed by Microsoft. From time to time, new versions of Active X have been released to provide support to the ever widening array of applications that are used in the home and the workplace. Active X can have an impact on applications that run quietly in the background, as well as applications that are used for online communications.

## What Does Active X Do?

Essentially, Active X is Microsoft's equivalent to Java, the tool manufactured by [Sun Microsystems](http://www.sun.com). This means that Active X can provide the means to launch a wide range of online features, such as the ability to view screens in a web conference, participate in message boards, and interact with various types of online media.

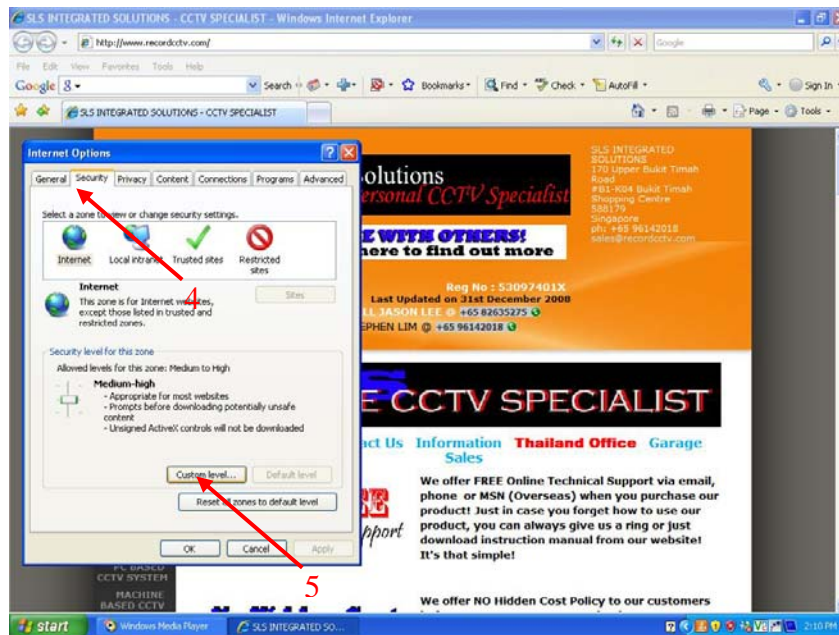

## Step by Step Guide to enable ActiveX...

1. Open *Internet Explorer icon* in your Windows Desktop. If you cannot find any icon on your Windows desktop, you may go to *Start > Internet Explorer*.

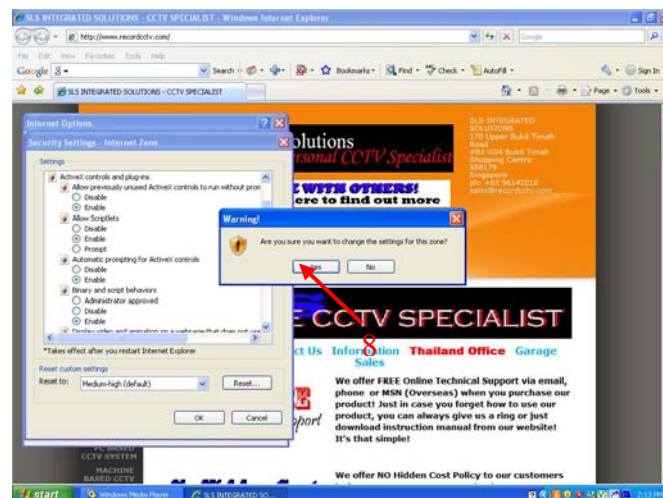

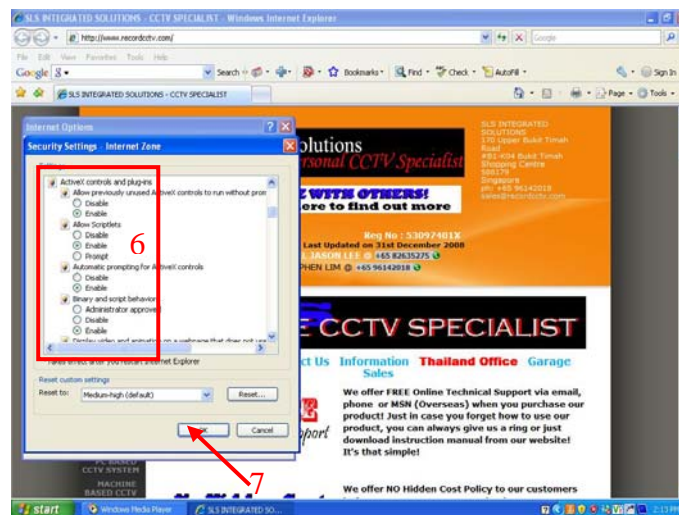

2. In your Internet Explorer, go to Tools > Internet Options

3. Click on *Security* tab and *Custom Level...*

4. Go to ActiveX section and click on *Enable* for all ActiveX related items.
5. Click on *OK* and then *YES*.

6. Click on *Apply*.
7. Close the Internet Options window and you are ready to log in to our demo website.
